PORTFOLIO PROJECT

I built an intercompany break resolver on Workday Extend

Detect → explain → draft → approve → audit.

A portfolio project built on a Workday Extend development tenant, using real intercompany journal data.

The month-end problem

Intercompany receivables and payables rarely match on day one of close.

Teams chase differences in spreadsheets, explanations live in email, and nobody can show who approved the fix.

I wanted that loop inside Workday, with controls built in.

How it works

1. Detect

Orchestration reads IC journal lines (RaaS) and compares 1900 receivable vs 2900 payable per company pair.

2. Explain

AI agent classifies each break: timing, FX, one-sided, wrong affiliate or unknown, with cited evidence.

3. Draft

Agent proposes a corrective action. A person confirms before it is drafted and submitted.

4. Approve

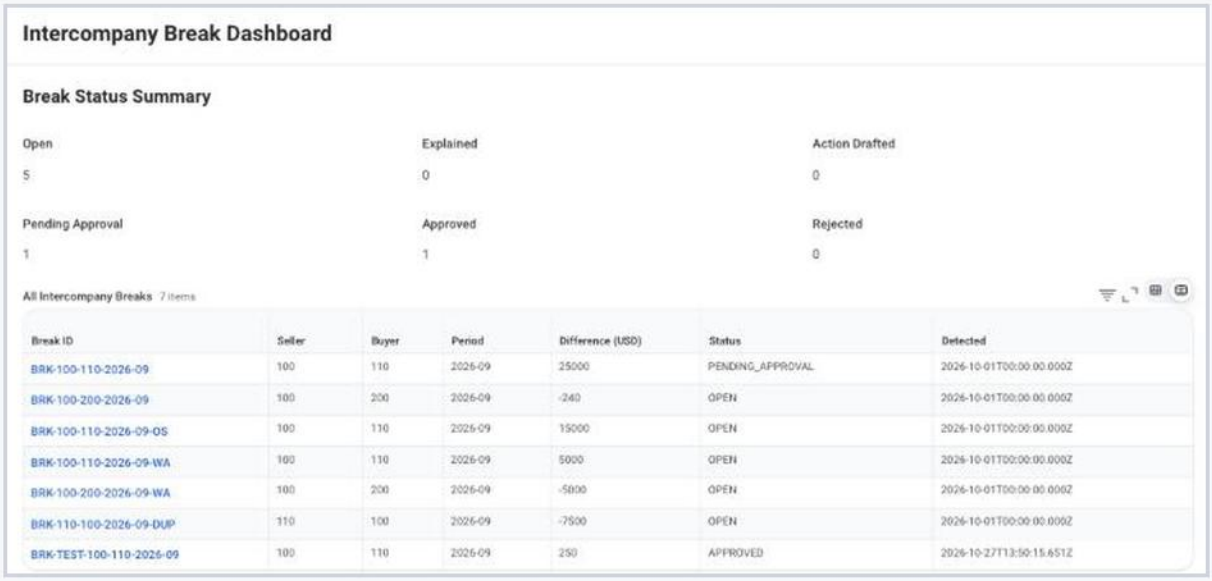

A Close Manager approves or rejects. The drafter can never approve their own action.

5. Audit

Every step writes to an append-only audit log.

Break dashboard

Status tiles and every open break, with a drill-down into each one.

Intercompany Break Dashboard

Break Status Summary

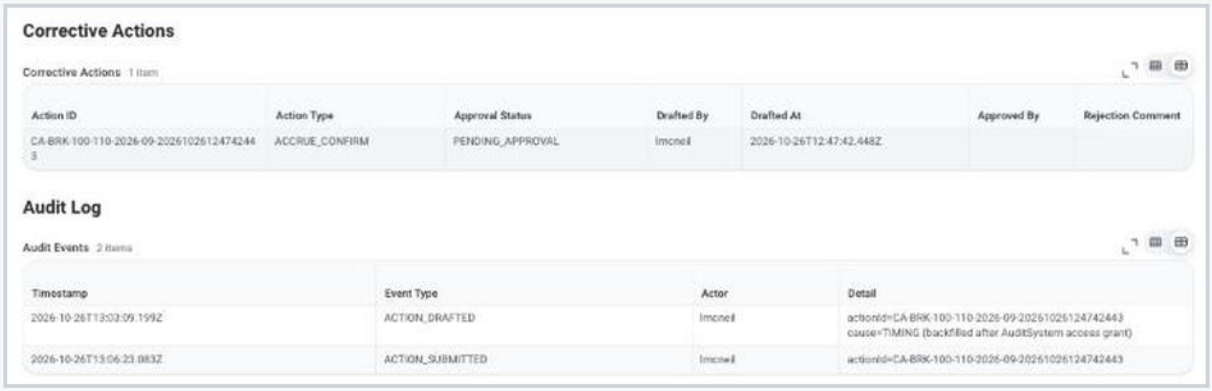

Open	Explained	Action Drafted
5	0	0
Pending Approval	**Approved**	**Rejected**
1	1	0

All Intercompany Breaks 7 items

Break ID	Seller	Buyer	Period	Difference (USD)	Status	Detected
BRK-100-110-2026-09	100	110	2026-09	25000	PENDING_APPROVAL	2026-10-01T00:00:00.000Z

Break detail

Seller and buyer lines, the corrective action and the full audit trail on one page.

Approve or reject

Close Managers see the proposed action and decide. A rejection needs a comment.

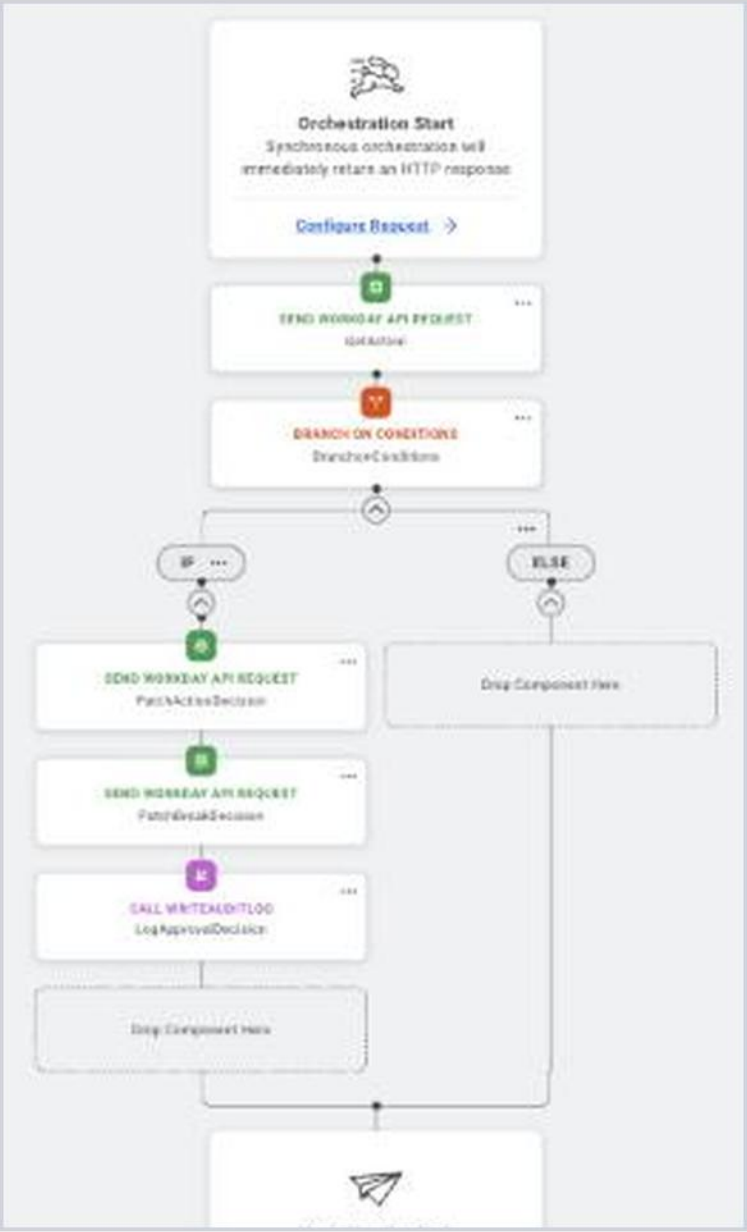

Segregation of duties

The person who drafted an action cannot approve it. Enforced in the orchestration, not just the UI.

The approval orchestration

One read, one decision branch, and writes only when every guard passes.

Controls I designed in

- Drafter ≠ approver, checked server-side
- Rejection comment required
- The AI agent can draft and submit, never approve
- Append-only audit log for every change
- Role-based security domains for pages and orchestrations

The bug that taught me the most

My first "drafter blocked" test passed. It was a false positive.

App logs showed the request was only 23 bytes: a hidden field never sent the action ID, so the check ran against the wrong record.

I moved the ID to the endpoint itself and made the orchestration fail closed unless the record matches. Test what is sent, not just what is shown.

STACK

Built with

Workday Extend: business objects, PMD pages, security domains

Workday Orchestrate: sync and async orchestrations

Reports-as-a-Service on intercompany journal lines

Workday AI agent with custom skills

Thanks for reading. Happy to walk through it.
